Functional & Performance Testing

Model Performance Test

Date	21 February 2026
Team ID	SWTID-2026-5878
Project Name	Automating Data Import and Relationship Mapping using Import Sets and Dot Walking
Maximum Marks	

Test Scenarios & Results

Test Case ID	Scenario (What to test)	Test Steps (How to test)	Expected Result	Actual Result	Pass/Fail
FT-01	Data Staging via Load Data (FR-1)	1. Navigate to Load Data. 2. Upload a valid CSV with 5 employee records. 3. Check `import_employee` table.	CSV is accepted; 5 rows are successfully created in the `import_employee` staging table.		
FT-02	Transform Map: String Fields (FR-2)	1. Run the Transform Map on the staged data. 2. Navigate to sys_user table. 3. Verify Name, Email, and Phone fields.	Name, Email, and Phone fields on the new `sys_user` records exactly match the CSV data.		
FT-03	Transform Map: Reference Fields (FR-2)	1. Open a newly imported user record in sys_user. 2. Check Department and Manager fields.	Department and Manager fields are successfully linked to the correct existing `sys_id` records, not just text strings.		
FT-04	Incident Form Auto-Population (FR-4)	1. Open a new Incident record. 2. Select one of the newly imported employees in the "Assigned to" field.	The employee's Department and Manager Email automatically appear on the form.		

Test Case ID	Scenario (What to test)	Test Steps (How to test)	Expected Result	Actual Result	Pass/Fail
RT-01	Error Handling for Missing References (NFR-3: Reliability)	1. Upload a CSV where one row has a Manager email that does not exist in the system. 2. Run Transform.	Transform completes. Valid rows are inserted. The invalid row logs an error (or ignores the manager field, based on config) but does not stop the batch.		
ST-01	Role-Based Access to Import (NFR-2: Security)	1. Impersonate a standard ITIL user. 2. Attempt to navigate to "Load Data" or "Transform Maps".	Access is denied. Module is hidden or restricted by ACLs. Only Admins/Import Admins have access.		
ST-02	UI Data Visibility (NFR-2: Security)	1. Impersonate an ITIL user. 2. View an Incident assigned to the new user.	ITIL user can view the dot-walked Department and Manager Email fields without triggering ACL read errors.		
UT-01	Dynamic Form Updates (NFR-1: Usability)	1. On an Incident, change the "Assigned to" user to person A, then to person B.	The dot-walked fields instantly update to reflect person B's details without requiring the user to save or reload the page.		
PT-01	Form UI Load Time (NFR-4: Performance)	1. Open an existing Incident with an assigned user. 2. Measure page load time.	The Incident form loads in under 2 seconds. The dot-walked fields do not cause noticeable UI lag.		
PT-02	Bulk Data Processing Limit (NFR-6: Scalability)	1. Upload a bulk CSV file containing 2,000 employee records. 2. Execute the Transform Map.	The platform processes all 2,000 records successfully within a reasonable timeframe (e.g., under 5 minutes) without timing out or degrading platform performance.
